Wepay report api

An example is the Sage Pay Server Epletotee any that is now handled with acceptance. If you need to consult a gateway to obtain a list of available settings, you can call `GetDefaultParameters()`; `Configuration = $ gateway-> GetDefaultParameters();` // Default configuration Matrix format: array ('username' => '...', // chain variable 'TESTMODE' => FALSE, // Boolean variable 'Landing Page' => Array ('Billing', 'Start session', // enum variable, the first element should be treated as a predetermined); In general, most payment gateways can be classified as one of the two types: off-site link doors, such as PayPal Express, where the customer is redirected to a third-party site to enter the payment details in the walkways on the site (hosted by merchant), as PayPal Pro, however, where the customer enters the details of his credit card on his site, there are some catwalks like Sage Pay Direct, where he takes the details of the card from credit on the site, then redirect optionally if the client card supports secure 3D authentication. A gravel adapter is required by default, when using League / OmniPay. The payment response must implement the response interruption. For the input gateways on the site, the following field fields are generally required: Name Name Number of Surname ExpiryMonth ExpiryYear CVV You can also check the number of the card using the Luhn algorithm calling `Helper::ValidateLuhn($Number)`. The acceptance method does not take any parameter and access the HTTP URL variables or publish data implicitly. Recurrent invoice in this stage, the automatic functionality of recurring payments is out of room for this library. Token's billing is not compatible with all doors of this has been designed based on active merchant ideas, in addition to the implementation experience of dozens of link doors for (CI Merchant). If you think you have found an error, repeat it using the github emission tracker for the appropriate package, or better, have an extraction request in your library and send an extraction request. If there is no version version V3 however, raise a problem or update the link doors yourself and create a PR. You must validate the details of the card using the validation library of your frame before sending the details to your gateway, to avoid unnecessary API calls. `$ Anspatiet-> ISDRIRECT();` // Is the answer a redirection? Make sure you need League / OmniPay or a separate HTTP adapter within a call from Ajax. You will want to return JS to the browser in place). To help with the handling of such notifications, the acceptance method () will extract the transaction reference and the payment status of the HTTP request and return a gender notification. The following methods are always available: `$ Answer = $ Gateway-> Buy (Array ('Amount' => '10.00', 'Card' => $ card)-> Send ();` If (\$ Answer-> ISSUCCESSFUL ()) { // Mark order as complete} Elseif (\$ Answer-> ISREDIRECT ()) { \$ Answer-> Redirect ();} Else { // Show at the client's exit { \$ Answer-> GetMessage ();} } } CAPT (\ Exception \$ E) // internal error, record the exception and show a generic message at the client's output ('Sorry, there was an error that processed your payment. You should use your own username As a prefix of the supplier, and Prepend OmniPay to the name of the package to do Delete that your package works with OmniPay. This is because there are probably too many differences between how each gateway handles the recurrent billing profiles. After processing a payment, the cart must verify whether the answer requires a redirection, and to be so, redirect accordingly: `$ response = $ gateway-> purchase (matrix ('amount' => '10.00', 'card' => 'cards')-> Send (); YES ($ Anspatiet-> Emission ();) // Payment is complete) Mayorie ($ Response-> ISREDIRECT ();) // this will automatically forward the client) Other the other (// not successful) The client is not automatically resended, because the carriage is often the carriage or developer will want to customize the redirection method (or if Payment processing is happening within a call from Ajax. You will want to return JS to the browser in place). To help with the handling of such notifications, the acceptance method () will extract the transaction reference and the payment status of the HTTP request and return a gender notification. The following methods are always available: $ Answer = $ Gateway-> Buy (Array ('Amount' => '10.00', 'Card' => $ card)-> Send (); $ Anspatiet-> Issuance (); // is the successful answer? In these cases, you must pass on the 'Action' ('Authorization' or 'purchase') in the Hourcard options. You can create new gateways by cloning the designer of an existing package. CreditCard parameters are data that supply the user. If any gateway does not support certain features (such as reimbursements), BadmethodCallexception will be launched. These are becoming complete messages * in repression. $ Forminputdata = array ('firstname' => 'Bobby', 'Surname' => 'Tables', 'Number' => '4111111111111111'); $ card = new credit card ($ Forminputdata); You can also pass the form data matrix To the gateway, and a credit card object will be created for you. The link doors that implement only the developer's account (most of them) call it TestMode. Support support you are having general problems with OmniPay, we suggest publishing on the overflow of the new. USA OMNIPAY \ OMNIPAY; $ Gateway = omnipay :: Create ('Stripe'); $ Gateway-> Setapikey ('ABC123'); $ Formdata = Array ('Number' => '42424242424242424242', 'ExpiryMonth' => '6', 'ExpiryYear' => '2030', 'CVV' => '123'); $ Answer = $ Gateway-> Buy (Array ('Amount' => '10.00', 'Currency' => 'USD', 'Card' => $ Formdata)-> Send (); Yes ($ Answer-> ISDRIRECT ()) { // redirect to payment payment OFFSITE $ Response-> Redirect (); } Mayorie ($ Answer-> Emission ()) { // Payment was successful: Update the Database Print_R ($ Answer); } Else { // Payment failed: Show message to the Customer ECHO ($ Answer); } As you can see, OmniPay has a consistent, well thought out API. If the payment authorization is reusable, the gateway will implement $ Answer-> GetCardreference (); To show your own redirection page, simply call GetRedirectURL (); in the answer, then visualize accordingly: $ URL = $ Answer-> GetRedirectURL (); // For a redirection of forms, you can also call the next method: $ Data = $ Response-> GetRedirectData (); // Associative Array of fields that must be published in the redirect error handling that you can test for a successful response by calling the expedition () in the response object. No problem is too small For example, if your Github username was holy, and is implementing the GRRPay payments library, a good name for your composer package would be Santa / OmniPay-GRRPay. When choosing a name for your package, do not use the omnipay provider prefix, as this implies that it is officially supported. Also, in most cases, token billing will cover your needs, as you can store a credit card and then charge you the schedule you like. see the Update for OmniPay / Note Cominal: The name of the package has been changed from OmniPay / OmniPay to League / OmniPay for V3 Pay Swayways All payment gateways must deploy GatewayInterface, and will usually be extended. For basic functionality. If you are free to get in touch if you really believe that this should be a central characteristic and worth the effort. Comments! We want this library to be useful in as many projects as possible. Example application An example application is provided in the omnipay / example repository. For example, you want the user to specify his first name and BillingCountry, but he does not want a user to specify the payment currency or return. There are no dependencies in the PHP packets of the official walkway of the catwalk: We prefer to work directly with HTTP API. $ Answer-> GetMessage (); // A message generated by the payment gateway in addition, most link doors will void the response object and provide access to the additional fields returned by the gateway. The method options are used for any specific payment option, which the client does not establish. These could be combined in a single kind of response, with a GetRedirectMethod (). The following link doors are available: The link doors are created and initialized as: Use OmniPay \ OmniPay; $ Gateway = omnipay :: Create ('PayPal_Express'); $ Gateway-> SetUSERNAME ('Adrian'); $ Gateway-> Setpassword ('12345'); Most of the configurations are specific to the gateway. Any past fields $ $ Authorize (Array ('Quantity' => '10', // This represents $ 10.00 'card' => $ card, 'Returnurl' => ')); When calling the complete or complete integration methods, the same arguments that when the initial initial or a purchase call (some link doors should verify, for example, the real amount paid is equal to the amount requested). It has a clear and consistent API, is completely proven in units and even comes with an example application to start. All of the binding door The main ma © all implemented by the link doors are: Authorize ($ options); Authorize an amount on the full customer card ($ options) - Manage the return of the link doors outside the Site after the capture of authorization ($ options) - capture an amount you have previously has an authorized purchase ($ options); authorize and immediately capture an amount in the complete understanding of the customer ($ options); handle the return of The link doors outside the site after the purchase reimbursement ($ options) - reimburse a transaction already null processed ($ options) - generally it can only be called up to 24 hours after sending an acceptance acceptance notification (); Convert an incoming application of a gateway outside the site to an object of generic notification to process a subsequent createcard; obtain a card reference that can be used for future payments. When implementing with multiple link doors, you must use a construction in the line of the following: if ($ is developer mode) (if (ma © all exists ($ gateway, 'setdevelopermode')) { $ gateway-> setdevelopermode (True); } else { $ gateway-> setestmode (True); } } Token Billing Token The billing allows you to store a crop card with your gateway and collect it at a later date. The OmniPay package design is a package collection that depends on the OmniPay/Common package to provide consistent interface. Tell yourself to the mail list and what you do and you don't like it, or disburse the project and make suggestions. If there was a communicating with the gateway, and your application was obviously not vian, it will launch an exception. Link doors on the site do not need to implement all complete and complete. Be sure to add the omnipay label so that it can be found easily. Link gates do not receive payment notifications, it is not necessary to implement acceptance acceptance. All of the catwalk, except acceptance, take a matrix of options of $ as an argument. We try to abstract as possible, the differences between the various payment catwalks. Creditcard fields can be accessed using getres and applicants: $ number = $ card-> Getnumber (); $ Card-> setfirstname ('Adrian'); If you send the details of the Cr © dito that, obviously, they are valid (the mandatory fields are missing, or a number that fails the verification of Luhn), it will be launched by invalidatorception. Safety If you discover any safety problem, send an email to barryvdh@gmail.com instead of using the emission tracker. OmniPay installation is installed through the composer. Incentive notifications Some link doors (for example, Gopysource, Gopay) offer HTTP notifications to inform the merchant about the completion (or, in general, the state) of the payment. Each gateway differs in which parameters are required, and the gateway will launch an invasive exception if it omits the required parameters. $ Response-> Gettransactionreference (); // A reference generated by the payment catwalk $ Respos-> Gettransactionid (); // The reference established by the website of origin if available. For example, the amount of payment, currency, transaction and return. Therefore, there is no differentiated point between the two types of gateway (otherwise for the world that support). If you want to stay with the income of liberation, discuss the ideas for the project, or ask detailed more questions, there is also an email list that can be subscribed. They will not be eliminated in OmniPay 2.x, but it is advisable to change the acceptance message when convenient. The entrance of the form of From the credit card / payment form it is directed to a credit card object. This method is always available (but can return null) of 3.1.1 Redirection response The redirect response is broken down by the client client You must redirect the use of obtaining (RedirectResponse Object), or Post (FormredRegResponse). There are two main types of response: Payment was successful (standard response) The website requires redirecting the out-of-site payment form (redirect response) Successful answer to obtain successful answers, a reference will be generated, which can be used to capture or reimburse the transaction at a later date. Authorize net, however, implements both and refers to this way as development the unreliable user input through the constructor. Some also allow you to perform test transactions against the live site, which does not result in a live transaction. The CreditCard object has the following fields: Name Name Number ExpiryMonth ExpiryYear Startmonth Startyear CVV Teaching Enumeracon Billingdress1 BillingState BillingState Billingstate Billingstate BillingState BillingPostern Swellingadress1 To pass the client's billing or sending details through the gateway. If an exception is launched, it is an error in its code (missing the required fields), or a communication error with the gateway. door.`
